

What do you do when you don't know what to do?

Are you tired of not knowing if your boiler is performing at the efficiency it should be?

Perhaps you don't have performance data to analyze just how your boiler is performing with regards to fuel efficiency. Or, worse yet, you don't know a problem has occurred until it's too late, leaving you and your organization vulnerable. Even if your boiler is running efficiently, having the technology to allow for remote operations, visibility into performance, real-time alarms and custom reporting will put the insights right at your fingertips.

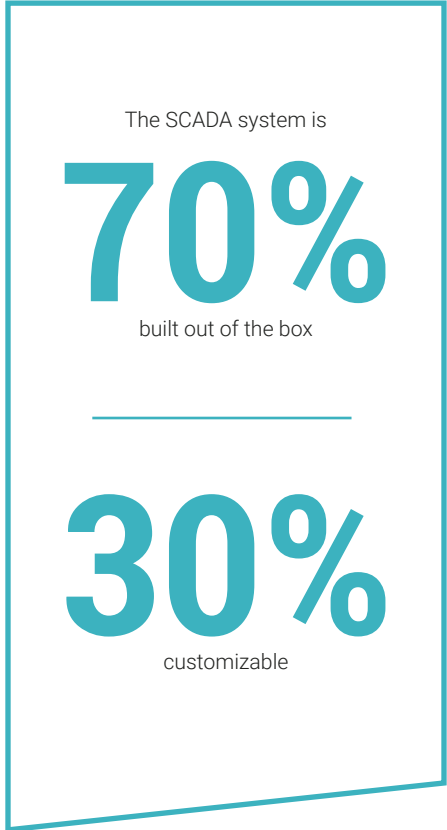

Depending on your situation, we can add RED Alert to your existing hardware/SCADA or build you an entirely new boiler control system. RED Alert gives you the technology you've been looking for and all the data and visibility you desire to get the maximum performance.

RED Alert is primed to give you maximum efficiency resulting in lower costs. The data you receive will provide insights into operations, maintenance and reliability, lowering downtime and the hurdle of costly repairs. Think of the possibilities. We

work with you to develop the best strategy based on your needs, including cybersecurity considerations. The cloud-based, hosted, SCADA system and controller are 70% built out of the box and 30% customized, allowing you to meet every need you have.

But what really makes RED Alert one of the best solutions out there is the ability to interface with other systems at a much lower cost, working together to maximize boiler efficiency.

At RED Group, we have an unwavering commitment to quality control, fit for purpose design, and impeccable support. We go the extra mile in testing all deployments of RED Alert before rolling them out, so our clients can trust that they'll work 24/7/365.

RED Alert gives you:

Maximum Efficiency

Lower Downtime

Maintenance Insights
