Best-in-class  
Control System  
Technology

Say goodbye to site visits and hello to automation.

You can use our hosted, cloud-based SCADA system or we can integrate into yours. RED Alert hardware and SCADA systems interface with other systems seamlessly.

Working in the water industry is not without its challenges. You may lack visibility into your assets and have little to no automation. Perhaps you lack sufficient IT/OT infrastructure or cybersecurity to support and protect your assets properly. Or maybe you don't have the funding for software updates, server upgrades, or the ability to design and build out a new infrastructure.

Now, imagine the ability to have remote operations to monitor and control your SCADA system while decreasing operating costs through integrating and empowering the use of technology. It's time you deploy a RED Alert package, which combines our controller and hosted SCADA platform to solve those challenges. When you utilize RED Group's team of engineers and field service professionals, we can design and install RED Alert, our flagship Industrial Controls and Hosted SCADA platform that provides best-in-class control systems technology, with the ability to customize to your needs.

When you utilize RED Alert, you'll have fewer operators traveling to sites to execute tasks that could be done remotely or through automation. This means you can increase your HSE posture and

leverage the team on higher value tasks. You'll have better visibility into your equipment status for up-time analysis, maintenance needs, and the reliability of your assets.

RED Alert gives you extreme efficiency resulting in lower costs. You will now have the data you need to maximize your operating efficiency, while minimizing your HSE risk exposure. Think of the possibilities. RED Group will work with you to develop the best strategy based on your needs. The SCADA system is 70% built out of the box and 30% customized, allowing us to meet every need you have. We have tremendous engineering and integration experience with these types of assets and can help you achieve success. You can either use our SCADA or we can integrate into your own or operate it locally. The ability of RED Alert to interface with other systems is seamless.

At RED Group, we have an unwavering commitment to cybersecurity, quality control, fit for purpose design, and impeccable support. We go the extra mile in testing all deployments of RED Alert before rolling them out, so our clients can trust that they'll work **24/7/365**.
